One job position that appeals to me in my major is Entry-level Web Developer. I tend to think this is rightfully a great position for me because not only is it a splendid field in programming, but there is also a great skill that retails in this environment that is fun to learn. As the world knows and has learned that ultimately the world will fully go digital, which in other words means that everything will become computer-based. Thus having this skill in the programming field will keep me as well as anyone who is fascinated by this job position on edge. Moreover, a Web Developer is a programmer who specializes in building web applications that we use on a daily basis, such as google, youtube or other applications that we use in our daily lives. This level of web development work requires programming skills to be effective, and do the work successfully. We have to use some programming languages such as HTML, CSS, Javascript and if one is good at these languages, then this job position will be second nature for those individuals. From my personal standpoint, the advantages that I have that will raise my chances of getting qualified for this job position are the knowledge and experience that I have taken away from the programming classes in the past. I have a good deal of experience in Java, Data Structure and HTML, and these attributes that I have will increase my chance to get qualified for the job. In contrast the factor that puts me at a disadvantage is the fact that I have yet to do an internship. Those who have done an internship and have excelled at these languages, their chances of getting a position in this area is a lot greater than that of mine. Since, I have never done an internship that corresponds to my major or the job field that I am interested in, this could lead to a disqualification. Now, to ensure that this requirement is met, I must get an

internship that associates with the job field, and need to make sure that my GPA is well-set too.

If I could successfully meet these requirements, then my chances of getting a position in Web Development will be skyrocketed. In order to acquire these skills, I have to do research online and analyze more about the field . I can talk to my friends who major in programming and have a job in the field to seek advice and suggestions that can assist me to get a job. I can watch Youtube videos of Web Development to gain more knowledge and can also constantly study JavaScript and other languages to solidify my chances to be ready for the real world.
