

Lab 2

Name: Mohd Parvez

Application Name: E-mail

Description: E-mail is a system to transmit messages electronically as between computers on a network. It is an application that is used by just about everyone professionally and on a daily basis when they would want to send homework, assignments, or other documents on a professional field. It is also used just to send a message, and more often than not I happen to be someone who uses Email on a constant basis.

Task 1:

- The first scenario when I might use this app would be when I must send an email with an attachment of my assignment to my instructor.
- This part of the email function entails the **recipient's email address, the subject, the attachment, and short description**, explaining the purpose of sending this email.
- If the task were not done accurately using the correct algorithm, there would be many things that could go wrong. For instance, If I put the wrong email address, the email would go to the wrong **recipient**. If I neglected to insert the email address, it would not be sent and cause an error.

Task 2:

- Another occasion I might use email would be when I need to look back at the emails that I may have sent in the past.

- To access old emails there some categories that one can check out to get access to those old emails. Depending on the sitaution, it could be in **Inbox, Sent, Draft, or All Trash**. These are avenues where old emails are loacted.
- If the actual date of email was not typed in the search bar, then email would not be found. Or maybe if the wrong name was typed or if the email was searched in the wrong category, it would cause an error and the email would not be found or located.

Task 3:

- Another instance when I would use email would be when I might be expecting an email from either a friend or family member, or anyone that I know would be sending one.
- Since I would be the **recipient** of an email I must make sure that the **sender** had the correct information, such as **my email address**. Also, the sender would have to clarify the **subject and the type of email that would be sent**.
- If the **sender** put the **wrong email address** then it would be sent to the wrong recipient, or if the sender forgot **any parts of the email address**, then it would cause **an error** and the email would not be sent to the recipient.
